Long-term Outcomes

Impact Goals

Mapping:
'What technologies currently exist that facilitate idea to product, taking into account the flexibility vs. cost trade off?'

An overview of solutions that already exist.

Funding:
Create exemplars of experimental device production tools, techniques, standards and services with environmental sustainability in mind.

Exemplar solutions are created.

Education:
We produce and share the theory and knowledge needed to go through the device production process.

Materials and events that help people to progress through the device production process.

Creating:
Create a network of technology providers and digital device producers.

A network of technology providers and digital device producers.

Mapping:
Unconventional electronics specific activity: Mapping spaces, tools and support available for making unconventional electronics, including prototypes.

An overview of things people need to know to prototype unconventional devices and progress them to production stage.

Create an accessible way to show people what they need to consider for their device production journey (awareness).

Consult with Network members on their problems and solutions for the device production journey.

Hold events encouraging Network member collaboration.

Tools, techniques and services that simplify device production are created (even if they are ad-hoc), with consideration for sustainability.

New standards for interoperability between suppliers and processes have been created, reducing waste and unnecessary production of new/specific parts.

A database and healthy community of tech providers and device producers advocate for solutions identified and created by the network.

A broad spectrum of people collaborate on ways to produce digital devices, ensuring they are as inclusive as possible.

UK seen as global leader in low volume, high mix device production.

People are using the newly created standards, platforms, tools, services etc. for both commercial and non-commercial applications.

More devices are produced through low volume manufacture by people who don't traditionally produce devices. This form of production gradually starts to reduce the demand for mass-produced devices.

Quality of life is enhanced for people through their increased ability to produce digital devices that are tailored to their needs.

More jobs are created due to an increase in low volume manufacture in the UK.

More efficient use of technological resource that leads to more sustainable consumption of digital devices.
